

Operational safety with **zero vision** on remarks during audit inspections

How can you be sure that the fire alarm system functions correctly when a fire situation arises? To ensure that the fire alarm operates effectively during a fire incident, regular inspections are required in accordance with the SBF regulations. These inspections should be conducted continuously, both on a monthly and quarterly basis. Throughout the year, a specific percentage of detectors must be tested, and all controls managed by the fire alarm system, such as doors, elevators, and ventilation, must be verified. It is crucial that these inspections are performed by qualified personnel with the necessary expertise to ensure compliance with all requirements.

We specialize in fire and gas alarm systems, and our qualified staff ensure that all inspections are carried out correctly in connection with the signing of service agreements. We also follow up with you to ensure that identified deficiencies are addressed. For clients with sensitive operations requiring continuous monitoring and support, we offer emergency service contracts with round-the-clock support, every day of the year.

We conduct inspections on all types of products, and you can feel completely assured that we will take care of your fire or gas alarm systems.

We strive for the highest possible operational reliability with a clear zero-tolerance policy for non-compliances during audit inspections. Through careful checks and proactive maintenance, we ensure that your systems function optimally, without deviations. Our goal is to create a safe and flawless operational environment for our clients.
